

Customer Churn Analysis Dashboard Report

Date: 29 April 2026

Dataset Used: Telco Customer Churn Dataset

Dataset Selection:

The Telco Customer Churn Dataset was selected because it contains well-structured customer, service, and billing data suitable for descriptive analysis. It includes a churn indicator for segmentation and KPI creation, along with numerical fields like MonthlyCharges and TotalCharges for revenue analysis. The dataset supports both categorical and numerical variables, making it ideal for building interactive dashboards.

Objective:

The objective of this task was to design an interactive dashboard using Tableau Desktop to analyze customer churn. The dashboard aims to display key metrics such as churn rate, active customers, and revenue at risk, while enabling analysis across segments like gender, contract type, and tenure through dynamic filtering.

Task Performed:

1. Imported the Telco Customer Churn Dataset into Tableau Desktop and verified data types.
2. Cleaned the dataset by converting required fields (e.g., TotalCharges) into numeric format and organizing dimensions and measures.
3. Created calculated fields such as Churn Flag, Active Customers, Churn Rate, and Revenue at Risk.
4. Developed KPI sheets to display Total Customers, Churn Rate, Active Customers, and Revenue at Risk.
5. Built visualizations including churn by gender, churn by contract type, churn trend by tenure, and revenue comparison.
6. Designed the dashboard layout using containers to organize KPI cards, charts, and filters.

7. Added filters (Gender, Contract, Internet Service) and applied them across all worksheets.
8. Enabled interactivity by configuring charts to act as filters for dynamic analysis.
9. Customized tooltips to display additional insights such as churn count and revenue impact.
10. Applied formatting techniques including color coding, font adjustments, spacing, and alignment for better readability.

Conclusion:

The dashboard provides a clear and interactive view of customer churn, highlighting key patterns across different customer segments. It effectively identifies areas with high churn and associated revenue risk, enabling better understanding of customer behavior. Overall, the dashboard supports data-driven decision-making through intuitive visuals and dynamic filtering.
